

# Algorithms and Data Structures: Network Flows

24th & 28th Oct, 2014

# Flow Networks

## Definition 1

A *flow network* consists of

- ▶ A directed graph  $\mathcal{G} = (V, E)$ .
- ▶ A *capacity function*  $c : V \times V \rightarrow \mathbb{R}$  such that  $c(u, v) \geq 0$  if  $(u, v) \in E$  and  $c(u, v) = 0$  for all  $(u, v) \notin E$ .
- ▶ Two distinguished vertices  $s, t \in V$  called the *source* and the *sink*, respectively.

We read  $(u, v)$  to mean  $u \rightarrow v$ .

## Assumption

Each vertex  $v \in V$  is on some *directed path* from  $s$  to  $t$ . This implies that  $\mathcal{G}$  is connected (but not necessarily strongly connected), and that  $|E| \geq |V| - 1$ .

# Example

For this graph,  $V = \{s, r, u, v, w, x, y, z, t\}$ . The edge set is

$$E = \{(s, u), (s, r), (s, x), (u, v), (u, x), (v, x), (v, w), (r, w), (r, y), (x, y), (y, r), (y, z), (z, w), (z, t), (w, t)\}.$$

Some examples of *capacities* are  $c(s, x) = 10$ ,  $c(r, y) = 5$ ,  $c(v, x) = 20$  and  $c(v, r) = 0$  (since there is no arc from  $v$  to  $r$ ).

# Network Flows

## Definition 2

Let  $\mathcal{N} = (\mathcal{G} = (V, E), c, s, t)$  be a flow network.

A *flow* in  $\mathcal{N}$  is a function

$$f : V \times V \rightarrow \mathbb{R}$$

satisfying the following conditions:

**Capacity constraint:**  $f(u, v) \leq c(u, v)$  for all  $u, v \in V$ .

**Skew symmetry:**  $f(u, v) = -f(v, u)$  for all  $u, v \in V$ .

**Flow conservation:** For all  $u \in V \setminus \{s, t\}$ ,

$$\sum_{v \in V} f(u, v) = 0.$$

## Network Flows (cont'd)

$\mathcal{N} = (\mathcal{G} = (V, E), c, s, t)$  flow network,  $f : V \times V \rightarrow \mathbb{R}$  flow in  $\mathcal{N}$ .

- ▶ For  $u, v \in V$  we call  $f(u, v)$  the *net flow* at  $(u, v)$ .
- ▶ The *value* of the flow  $f$  is the number

$$|f| = \sum_{v \in V} f(s, v).$$

Notice that our particular defn. of flow (the “skew-symmetry” constraint) ensures that  $f(u, v)$  is truly the “net flow” in the usual sense of the word (e.g. if  $(r, y)$  on slide 2 was to carry flow 3, and  $(y, r)$  to carry flow 4, we will have  $f(r, y) = -1$ ).

# Example

A flow of value 18.

Only positive net flows are shown.

# The Maximum-Flow Problem

**Input:** Network  $\mathcal{N}$

**Output:** Flow of maximum value in  $\mathcal{N}$

The problem is to find the flow  $f$  such that  $|f| = \sum_{v \in V} f(s, v)$  is the largest possible (over all “legal” flows).

# The Ford-Fulkerson Algorithm

Published in 1956 by Delbert Fulkerson and Lester Randolph Ford Jr.

**Algorithm** FORD-FULKERSON( $\mathcal{N}$ )

1.  $f \leftarrow$  flow of value 0
2. **while** there exists an  $s \rightarrow t$  path  $\mathcal{P}$  in the “residual network” **do**
3.      $f \leftarrow f + f_{\mathcal{P}}$ ;
4.     Update the “residual network”.
5. **return**  $f$

The “residual network” is  $\mathcal{N}$  with the “used-up” capacity removed.

To make this precise, we need notation, and proofs - [this lecture](#).

## Some Technical Observations

$\mathcal{N} = (\mathcal{G} = (V, E), c, s, t)$  flow network,  $f : V \times V \rightarrow \mathbb{R}$  flow in  $\mathcal{N}$ ,  $u, v \in V$ .

1.  $f(u, u) = 0$  for all  $u \in V$ .

*“Proof”*:  $f(u, u) = -f(u, u)$  by skew symmetry.

2. For any  $v \in V \setminus \{s, t\}$ ,

$$\sum_{u \in V} f(u, v) = 0.$$

*Proof*:  $\sum_{u \in V} f(u, v) = -\sum_{u \in V} f(v, u) = 0$  by skew symmetry and flow conservation.

3. If  $(u, v) \notin E$  and  $(v, u) \notin E$  then  $f(u, v) = f(v, u) = 0$ .

*Proof*: Either  $f(u, v)$  or  $f(v, u) \geq 0$  by skew symmetry. Say,  $f(u, v) \geq 0$ . Then  $0 \leq f(u, v) \leq c(u, v) = 0$  by the capacity constraint. So  $f(u, v) = 0$ . By skew symmetry, this shows  $f(v, u) = 0$ .

## One More Technical Observation

4. The *positive net flow entering*  $v$  is:

$$\sum_{\substack{u \in V \\ f(u,v) > 0}} f(u,v).$$

The *positive net flow leaving*  $v$  is defined symmetrically.

Flow conservation now says:

“positive net flow in = positive net flow out”.

All these observations are just to make it easy for us to talk about flows.

## Working with Flows

*Implicit summation notation:* For  $X, Y \subseteq V$  put

$$f(X, Y) = \sum_{u \in X} \sum_{v \in Y} f(u, v) = \sum_{(u, v) \in X \times Y} f(u, v).$$

*Abbreviations:*

$f(u, Y)$  stands for  $f(\{u\}, Y)$  and  
 $f(X, v)$  stands for  $f(X, \{v\})$ .

Conservation of flow is now:

$$f(u, V) = 0 \quad \text{for all } u \in V \setminus \{s, t\}.$$

## Working with Flows (cont'd)

### Lemma 3

$\mathcal{N} = (\mathcal{G} = (V, E), c, s, t)$  flow network,  $f$  flow in  $\mathcal{N}$ .

Then for all  $X, Y, Z \subseteq V$ ,

1.  $f(X, X) = 0$ .
2.  $f(X, Y) = -f(Y, X)$ .
3. If  $X \cap Y = \emptyset$  then

$$f(X \cup Y, Z) = f(X, Z) + f(Y, Z),$$

$$f(Z, X \cup Y) = f(Z, X) + f(Z, Y).$$

Lemma “lifts” Network flow properties to sets-of-vertices.

### Proof of Lemma 3

$$\begin{aligned} 1. \quad f(X, X) &= \sum_{(u,v) \in X \times X} f(u, v) && \text{by defn. of } f(X, X) \\ &= \sum_{\{u,v\} \subseteq X} (f(u, v) + f(v, u)) && \text{take } (u, v), (v, u) \text{ together} \\ &= 0. && \text{by skew-symm} \end{aligned}$$

$$\begin{aligned} 2. \quad f(X, Y) &= \sum_{(u,v) \in X \times Y} f(u, v) && \text{by defn of } f(X, Y) \\ &= \sum_{(u,v) \in X \times Y} -f(v, u) && \text{by skew-symmetry} \\ &= - \sum_{(v,u) \in Y \times X} f(v, u) && \text{take } - \text{ outside the summation} \\ &= -f(Y, X). && \text{by defn of } f(Y, X) \end{aligned}$$

## Proof of Lemma 3 (cont'd)

3.

$$\begin{aligned} f(X \cup Y, Z) &= \sum_{u \in X \cup Y} \sum_{v \in Z} f(u, v) \\ &= \sum_{u \in X} \sum_{v \in Z} f(u, v) + \sum_{u \in Y} \sum_{v \in Z} f(u, v) - \sum_{u \in X \cap Y} \sum_{v \in Z} f(u, v) \\ &\quad \text{(expand sum into } X \text{ and } Y, \text{ subtract duplicates in } X \cap Y) \\ &= \sum_{u \in X} \sum_{v \in Z} f(u, v) + \sum_{u \in Y} \sum_{v \in Z} f(u, v) \\ &\quad \text{(but } X \cap Y = \emptyset, \text{ so third term disappears)} \\ &= f(X, Z) + f(Y, Z). \end{aligned}$$

Moreover,

$$f(Z, X \cup Y) = -f(X \cup Y, Z) = -(f(X, Z) + f(Y, Z)) = f(Z, X) + f(Z, Y).$$

## Working with Flows (cont'd)

### Corollary 4

$\mathcal{N} = (\mathcal{G} = (V, E), c, s, t)$  flow network,  $f$  flow in  $\mathcal{N}$ . Then

$$|f| = f(V, t).$$

*Proof:*

$$\begin{aligned} |f| &= f(s, V) && \text{(by definition)} \\ &= f(V, V) - f(V \setminus \{s\}, V) && \text{(by Lemma 3 (3.))} \\ &= -f(V \setminus \{s\}, V) && \text{(by Lemma 3 (1.))} \\ &= f(V, V \setminus \{s\}) && \text{(by Lemma 3 (2.))} \\ &= f(V, t) + f(V, V \setminus \{s, t\}) && \text{(by Lemma 3 (3.))} \\ &= f(V, t) + \sum_{v \in V \setminus \{s, t\}} f(V, v) && \text{(by Definition)} \\ &= f(V, t) && \text{(by flow conservation)} \end{aligned}$$

# Residual Networks

Idea is to capture possible extra flow given current flow.

## Definition 5

$\mathcal{N} = (\mathcal{G} = (V, E), c, s, t)$  flow network,  $f$  flow in  $\mathcal{N}$ .

1. For all  $u, v \in V \times V$ , the *residual capacity* of  $(u, v)$  is

$$c_f(u, v) = c(u, v) - f(u, v).$$

2. The *residual network* of  $\mathcal{N}$  induced by  $f$  is

$$\mathcal{N}_f((V, E_f), c_f, s, t),$$

where

$$E_f = \{(u, v) \in V \times V \mid c_f(u, v) > 0\}$$

Notice that  $E_f$  may contain edges not originally in  $E$  (“back-edges”).

# Example

A flow and the corresponding residual network

# Adding Flows

## Lemma 6

Let  $\mathcal{N} = (\mathcal{G} = (V, E), c, s, t)$  be a flow network.

Let  $f$  be a flow in  $\mathcal{N}$ .

Let  $g : V \times V \rightarrow \mathbb{R}$  be a flow in the residual network  $\mathcal{N}_f$ .

Then the function  $f + g : V \times V \rightarrow \mathbb{R}$  defined by

$$(f + g)(u, v) = f(u, v) + g(u, v)$$

is a flow of value  $|f| + |g|$  in  $\mathcal{N}$ .

## Proof of Lemma 6

First we have to check that  $f + g$  is actually a flow in  $\mathcal{N}$ .

Capacity constraints:

$$\begin{aligned}(f + g)(u, v) &= f(u, v) + g(u, v) \\ &\leq f(u, v) + c_f(u, v) \\ &= f(u, v) + c(u, v) - f(u, v) \\ &= c(u, v).\end{aligned}$$

Skew symmetry:

$$(f + g)(u, v) = f(u, v) + g(u, v) = -f(v, u) - g(v, u) = -(f + g)(v, u).$$

Flow Conservation: For every  $u \in V \setminus \{s, t\}$ :

$$\sum_{v \in V} (f + g)(u, v) = \sum_{v \in V} f(u, v) + \sum_{v \in V} g(u, v) = 0 + 0 = 0.$$

## Proof of Lemma 6 (cont'd)

Next we have to check that  $f + g$  does have the value that we claimed for it.

Value:

$$\begin{aligned} |f + g| &= \sum_{v \in V} (f + g)(s, v) \\ &= \sum_{v \in V} f(s, v) + \sum_{v \in V} g(s, v) \\ &= |f| + |g|. \end{aligned}$$

# Augmenting Paths

## Definition 7

$\mathcal{N} = (\mathcal{G} = (V, E), c, s, t)$  flow network,  $f$  flow in  $\mathcal{N}$ .

Then an *augmenting path* for  $f$  is a path  $\mathcal{P}$  from  $s$  to  $t$  in the residual network  $\mathcal{N}_f$ .

The *residual capacity* of  $\mathcal{P}$  is

$$c_f(\mathcal{P}) = \min\{c_f(u, v) \mid (u, v) \text{ edge on } \mathcal{P}\}.$$

Note that  $c_f(\mathcal{P}) > 0$ , by definition of  $E_f$  (recall that we only keep edges in  $E_f$  if their residual capacity is strictly positive).

# Example

An augmenting path of residual capacity 10

# Pushing Flow through an Augmenting Path

## Lemma 8

$\mathcal{N} = (\mathcal{G} = (V, E), c, s, t)$  flow network,  $f$  flow in  $\mathcal{N}$ .

$\mathcal{P}$  augmenting path. Then  $f_{\mathcal{P}} : V \times V \rightarrow \mathbb{R}$  defined by

$$f_{\mathcal{P}}(u, v) = \begin{cases} c_f(\mathcal{P}) & \text{if } (u, v) \text{ is an edge of } \mathcal{P}, \\ -c_f(\mathcal{P}) & \text{if } (v, u) \text{ is an edge of } \mathcal{P}, \\ 0 & \text{otherwise} \end{cases}$$

is a flow in  $\mathcal{N}_f$  of value  $c_f(\mathcal{P})$ .

*Proof left as an exercise.* It is not too difficult - just have to check that the three conditions of a flow are satisfied (and that the value is  $c_f(\mathcal{P})$ ). Similar to Lemma 6.

# Augmenting a Flow

## Corollary 9

$\mathcal{N} = (\mathcal{G} = (V, E), c, s, t)$  flow network,  $f$  flow in  $\mathcal{N}$ . Let  $\mathcal{P}$  be an augmenting path. Then  $f + f_{\mathcal{P}}$  is a flow in  $\mathcal{N}$  of value

$$|f| + c_f(\mathcal{P}) > |f|.$$

*Proof:* Follows from Lemma 6 and Lemma 8.

# The Ford-Fulkerson Algorithm

**Algorithm** FORD-FULKERSON( $\mathcal{N}$ )

1.  $f \leftarrow$  flow of value 0
2. **while** there exists an augmenting path  $\mathcal{P}$  in  $\mathcal{N}_f$  **do**
3.      $f \leftarrow f + f_{\mathcal{P}}$
4. **return**  $f$

To prove that FORD-FULKERSON correctly solves the Maximum Flow problem, we have to prove that:

1. The algorithm terminates.
2. After termination,  $f$  is a maximum flow.

# Cuts

## Definition 10

$\mathcal{N} = (\mathcal{G} = (V, E), c, s, t)$  flow network.

A *cut* of  $\mathcal{N}$  is a pair  $(S, T)$  such that:

1.  $s \in S$  and  $t \in T$ ,
2.  $V = S \cup T$  and  $S \cap T = \emptyset$ .

The *capacity* of the cut  $(S, T)$  is

$$c(S, T) = \sum_{u \in S, v \in T} c(u, v).$$

# Example

A cut of capacity 45.

# Example

A cut of capacity 25.

# Cuts and Flows

## Lemma 11

$\mathcal{N} = (\mathcal{G} = (V, E), c, s, t)$  flow network,  $f$  flow in  $\mathcal{N}$ ,  $(S, T)$  cut of  $\mathcal{N}$ .  
Then

$$|f| = f(S, T).$$

*Proof:* We apply Lemma 3:

$$\begin{aligned} |f| &= f(s, V) \\ &= f(s, V) + f(S - \{s\}, V) \quad [t \notin S \Rightarrow f(S - \{s\}, V) = 0] \\ &= f(S, V) \\ &= f(S, T) + f(S, S) \\ &= f(S, T). \end{aligned}$$

## Cuts and Flows (cont'd)

### Corollary 12

*The value of any flow in a network is bounded from above by the capacity of any cut.*

*Proof:* Let  $f$  be a flow and  $(S, T)$  a cut. Then

$$|f| = f(S, T) \leq c(S, T).$$

# The Max-Flow Min-Cut Theorem

## Theorem 13

*Let  $\mathcal{N} = (\mathcal{G} = (V, E), c, s, t)$  be a flow network.*

*Then the maximum value of a flow in  $\mathcal{N}$  is equal to the minimum capacity of a cut in  $\mathcal{N}$ .*

## Proof of the Max-Flow Min-Cut Theorem

Let  $f$  be a flow of maximum value and  $(S, T)$  a cut of minimum capacity in  $\mathcal{N}$ . We shall prove that

$$|f| = c(S, T).$$

1.  $|f| \leq c(S, T)$  follows from Corollary 12.

So all we have to prove is that there is a cut  $(S, T)$  such that

$$c(S, T) \leq |f|.$$

2. First remember that  $|f|$  has no augmenting path.

*Proof:* If  $\mathcal{P}$  was an augmenting path, then  $f + f_{\mathcal{P}}$  would be a flow of larger value (because by definition of  $\mathcal{N}_f$ , all edges in  $\mathcal{N}_f$  have strictly positive weights).

3. Thus there is no path from  $s$  to  $t$  in  $\mathcal{N}_f$ . Let

$$S = \{v \mid \text{there is a path from } s \text{ to } v \text{ in } \mathcal{N}_f\}$$

and  $T = V \setminus S$ . Then  $(S, T)$  is a cut.

## Proof of the Max-Flow Min-Cut Theorem (cont'd)

4. By definition of  $S$ , and because reachability in graphs is a transitive relation, there cannot be any edge from  $S$  to  $T$  in  $\mathcal{N}_f$ . Thus for all  $u \in S$ ,  $v \in T$  we have  $c(u, v) - f(u, v) = 0$ .

5. Thus

$$c(S, T) = \sum_{u \in S} \sum_{v \in T} c(u, v) = \sum_{u \in S} \sum_{v \in T} f(u, v) = f(S, T) = |f|$$

(by Lemma 11).

# Corollaries

## Corollary 14

*A flow is maximum if, and only if, it has no augmenting path.*

*Proof:* This follows from the proof of the Max-Flow Min-Cut theorem.

## Corollary 15

*If the Ford-Fulkerson algorithm terminates, then it returns a maximum flow.*

*Proof:* The flow returned by FORD-FULKERSON has no augmenting path.

# Termination

Let  $f^*$  be a maximum flow in a network  $\mathcal{N}$ .

- ▶ If all capacities are integers, then FORD-FULKERSON stops after at most

$$|f^*|$$

iterations of the main loop.

- ▶ If all capacities are rationals, then FORD-FULKERSON stops after at most

$$q \cdot |f^*|$$

iterations of the main loop, where  $q$  is the least common multiple of the denominators of all the capacities.

- ▶ For arbitrary real capacities, it may happen that FORD-FULKERSON does not stop.

# A Nasty Example

# The Edmonds-Karp Heuristic

## Idea

Always choose a shortest augmenting path.

$n$  number of vertices,  $m$  number of edges. Recall that  $n \leq m + 1$

A shortest augmenting path can be found by **Breadth-First-Search** (reading assignment) in time  $O(n + m) = O(m)$ .

## Theorem 16

*The Ford-Fulkerson algorithm with the Edmonds-Karp heuristic stops after at most  $O(nm)$  iterations of the main loop.*

*Thus the running time is  $O(nm^2)$ .*

# Interesting Example

We will run Ford-Fulkerson (with the Edmonds-Karp heuristic) on this network. This is interesting because we will see the “back-edges” being used to “undo” part of an previous augmenting path.

## Interesting Example cont.

1st augmenting path:  $s \rightarrow r \rightarrow w \rightarrow t$ .

Length is 3 (so we satisfy Edmonds-Karp rule to take a shortest possible path). Min capacity is 10, so we push flow of 10 along the path. Starting flow becomes 10.

## Interesting Example cont.

Residual network after adding first flow of value 10 along  $s \rightarrow r \rightarrow w \rightarrow t$ .

The newly-created "back-edges" are shown in red.

## Interesting Example cont.

There is no longer any augmenting path of length  $\leq 3$ , and the only one of length 4 is  $s \rightarrow x \rightarrow y \rightarrow z \rightarrow t$ , which has a minimum capacity  $\min\{10, 10, 15, 15\}$ , ie 10.

We push this extra flow of value 10 along  $s \rightarrow x \rightarrow y \rightarrow z \rightarrow t$ , bringing overall flow to 20.

## Interesting Example cont.

Residual network after adding flow from second augmenting path  $s \rightarrow x \rightarrow y \rightarrow z \rightarrow t$ , overall flow now 20.

## Interesting Example cont.

Now there is only one simple augmenting path -  $s \rightarrow u \rightarrow v \rightarrow w \rightarrow r \rightarrow y \rightarrow z \rightarrow t$ , with minimum residual capacity 5.

Notice we use the “back-edge”  $w \rightarrow r$  in our path. This is essentially “re-shipping” 5 units from the first flow-path away from  $r \rightarrow w \rightarrow t$  and along  $r \rightarrow y \rightarrow z \rightarrow t$  instead.

# Interesting Example

Residual network after adding 3rd flow, of value 5  $\Rightarrow$  total flow 25.

There is no longer *any* augmenting path in our residual network (set of vertices “reachable” from  $s$  is  $\{s, u, v, x, w, r\}$ ).

# Reading and Problems

[CLRS] Chapter 26

For breadth-first search: [CLRS], Section 22.2.

## Problems

1. Exercise 26.1-5 of [CLRS] (ed 2).

*Not in [CLRS] (ed 3). Question is: consider Figure 26.1(b) and find a pair of subsets  $X, Y \subseteq V$  such that  $f(X, Y) = -f(V \setminus X, Y)$ .*

*After that, find a pair of subsets  $X', Y' \subseteq V$  for which  $f(X', Y') \neq -f(V \setminus X', Y')$ .*

2. Exercise 26.2-2 of [CLRS] (2nd ed), Ex 26.2-3 of [CLRS] (3rd ed).
3. Prove Lemma 8.
4. Problem 26-4 of [CLRS].
